Chapter 8: Dimensionality Reduction

Aly Khaled

August 20, 2021

1 The Curse of Dimensionality

- The more dimensions the training set has, the greater the risk of **overfitting** it.

- One solution to the curse of dimensionality could be to **increase** the size of the training set to reach a sufficient density of training instances.

- Unfortunately, the number of training instances required to reach a given density grows **exponentially** with the number of dimensions.

2 Approaches for Dimensionality Reduction

- There are two main approaches to reducing dimensionality **Projection** and **Manifold**.

2.1 Projection

-

2.2 Manifold Learning

-

3 Dimensionality reduction algorithms:

- There are many dimensionality reduction algorithms like: PCA, Kernel PCA, LLE
